## SUMMARY OF FINDINGS

An estimated 2,022,700 persons aged 15 to 64 (19.0 per cent of the civilian population in the same age group) attended an educational institution at some time in 1986. Some 1,200,900 (59.4 per cent) of these persons attended full-time while the remaining 821,800 (40.6 per cent) attended part-time.

About three out of every four persons (871,700) who attended full-time education in 1986 were continuing full-time education at May 1987. The remaining 329,200 were classified as *Leavers* — that is, persons who were full-time students at any time in 1986 but were not full-time students at May 1987.

**DIAGRAM 1. LEAVERS AGED 15 TO 64: LEAVERS AS A PROPORTION OF PERSONS WHO ATTENDED AN EDUCATIONAL INSTITUTION FULL-TIME IN PREVIOUS YEAR AND AGE, MAY 1985 TO MAY 1987**  
(Source of data: Table 1)

More than eighty per cent of persons who attended an educational institution full-time in 1986 were teenagers, 12.6 per cent were aged 20 to 24 and 6.3 per cent were in the 25 to 64 age group.

During the period May 1983 to May 1987 the proportion of teenagers who were attending an educational institution full-time has been increasing. Some 48.0 per cent of persons aged 15 to 19 were attending full-time at May 1983 and this proportion increased to 55.5 per cent at May 1987.

Successive surveys from May 1983 to May 1986 showed that the number of leavers as a proportion of those who attended full-time in the previous year remained steady at approximately 31 per cent. However in May 1987 this proportion decreased to 27.4 per cent.

This proportion of leavers amongst 15 to 19 year olds decreased from 26.5 per cent in 1986 to 23.5 per cent in 1987. Persons aged 25 to 64 who attended full-time in the previous year were more likely to have left full-time education than those in the younger age groups — 54.7 per cent had left full-time education at May 1987. This was a decrease from 61.6 per cent at May 1986.

Of the 2,022,700 persons aged 15 to 64 who attended an educational institution in 1986, 909,200 (44.9 per cent) attended school. At May 1987 the majority of these people (618,200) were still attending school, 125,600 were attending tertiary institutions and 165,400 were not attending an educational institution. Of the 125,600 who attended school in 1986 and were attending tertiary institutions at May 1987, 63,400 were attending TAFE or technical college, 26,900 were attending CAE, 26,500 were attending university and the remaining 8,900 were attending other tertiary institutions.

**DIAGRAM 2. PERSONS AGED 15 TO 64 WHO ATTENDED AN EDUCATIONAL INSTITUTION IN 1986: TYPE OF EDUCATIONAL INSTITUTION ATTENDED IN 1986, WHETHER ATTENDING AN EDUCATIONAL INSTITUTION, TYPE OF EDUCATIONAL INSTITUTION ATTENDING AND LABOUR FORCE STATUS, MAY 1987**

(Source of data: Tables 6, 9 and 10)

(a) Estimate subject to sampling variability too high for most practical uses.

Industries that employed the highest numbers of school leavers were wholesale and retail trade (36.6 per cent or 51,600 persons), manufacturing (16.6 per cent or 23,400 persons) and finance, property and business services (13.3 per cent or 18,700 persons). Occupations of these school leavers were largely confined to four groups—salespersons and personal service workers (25.3 per cent), tradespersons (24.9 per cent), labourers and related workers (21.9 per cent) and clerks (21.3 per cent).

Depending upon the type of institution attended in 1986 the labour force status varied amongst persons who were not attending an educational institution at May 1987. Of those who attended school in 1986, 68.7 per cent were employed, 22.5 per cent were unemployed and 8.8 per cent were not in the labour force at May 1987. The resulting unemployment rate was 24.7 per cent. In contrast, of those who attended a tertiary institution in 1986, 80.4 per cent were employed, 7.1 per cent were unemployed and 12.5 per cent were not in the labour force at May 1987. The resulting unemployment rate for this group was 8.2 per cent.

For those 281,500 persons aged 15 to 24 who attended school in 1986 but were not attending school at May 1987 it was established that 78.0 per cent (219,700) had last attended a government or state school, while 22.0 per cent (61,800) had last attended a non-government school. The unemployment rate was higher amongst those who left a government or state school (24.0 per cent) than amongst those who left a non-government school (14.3 per cent).

Of those 219,700 students aged 15 to 24 who last attended a government or state school in 1986 and were not attending school at May 1987, 39.6 per cent were attending a tertiary institution at May 1987. The breakdown of the type of tertiary institution they were attending is as follows — 58.0 per cent at TAFE or technical college, 18.7 per cent at CAE and 16.3 per cent at university. This compares with a relatively high proportion of students who last attended non-government schools in 1986 who went on to attend a tertiary institution at May 1987 — 60.5 per cent. Some 32.9 per cent of these were attending TAFE or technical college, 26.7 per cent CAE and 32.4 per cent university.

Apprentices at May 1987 numbered 139,700 (87.9 per cent of whom were males), compared with 134,500 at May 1986 and 147,800 at May 1985. Most apprentices at May 1987 were in the 17 to 19 age range. Apprentices aged 17 accounted for 18.5 per cent, 18 year olds accounted for 21.8 per cent while 19.6 per cent of apprentices were aged 19.

Some 39,000 (27.9 per cent) of apprentices were in their first year of apprenticeship and 40,200 (28.8 per cent) were in their second year. Third and fourth/fifth year apprentices accounted for 23.8 per cent and 19.5 per cent respectively.

The majority of apprentices were employed in the non-government sector, with only 18,200 employed by the government.

Fields of trade that employed the most apprentices included building (17.3 per cent), electrical and electronics (14.1 per cent), vehicle (13.8 per cent) and metal fitting and machining (10.9 per cent). A further 9.8 per cent were employed in the hairdressing field of trade - 91.2 per cent of these apprentices were females.

Industries that employed the highest number of apprentices were manufacturing (27.4 per cent), wholesale and retail trade (21.8 per cent), construction (19.8 per cent) and recreation, personal and other services (13.7 per cent).

Since May 1983 the proportion of apprentices working in the manufacturing industry has decreased from 34.5 per cent to 27.4 per cent at May 1987. Conversely, the proportion of apprentices working in the construction industry has marginally increased from 14.6 per cent at May 1983 to 19.8 per cent at May 1987.

More than eighty per cent of apprentices attended an educational institution at some time during 1986. 21.5 per cent attended school in 1986, most of whom were in the first year of their apprenticeship at May 1987. Conversely, most of the apprentices who attended a tertiary institution at some time during 1986 were in the second to fifth year of their apprenticeship at May 1987.

## EXPLANATORY NOTES

### Introduction

The monthly population survey (which is described in *The Labour Force, Australia* (6203.0)) comprises the monthly labour force survey and supplementary topics. This publication contains some results of a supplementary survey run in association with the May 1987 labour force survey conducted throughout Australia.

2. Of the respondents to the labour force survey, those who fell within the scope of the supplementary survey were asked additional questions. They were asked whether they were attending, or had attended in the previous year, an educational institution and, if so, the type of educational institution and the type of attendance. If respondents were not attending an educational institution full-time at May 1987 they were asked the year they finished full-time study. Persons who had left full-time study during the previous year were asked the time of the year they had left. In respect of apprentices, information was obtained on their year of apprenticeship and field of trade.

### Scope

3. The scope of this supplementary survey was the same as that used for the labour force survey (described in full in *The Labour Force, Australia* (6203.0)) except that it was restricted to persons aged 15 to 64 and excluded persons permanently unable to work, some patients in hospitals and sanatoriums and inmates of reformatories, gaols, etc. The population for apprentices was further restricted to employed persons aged 15 to 34.

### Coverage

4. In the population survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. See *The Labour Force, Australia* (6203.0) for more details.

### Definitions

5. Definitions of the principal labour force categories appearing in this publication are given in *The Labour Force, Australia* (6203.0).

6. An *educational institution* is defined as any institution whose primary role is education. Included are schools, universities, colleges of advanced education, colleges of technical and further education, public and private colleges, etc. Excluded are institutions whose primary role is not education, for example hospitals.

7. The classification *other educational institution*, which is part of the variable *type of educational institution attended/ing* includes: business, commercial and secretarial colleges; religious and theological colleges; and overseas institutions.

8. Persons are regarded as *attending an educational institution full-time* if they consider themselves to be attending full-time or the institution which they are attending so classifies them.

9. *Attendance at an educational institution during the previous year* refers to any period of study during that calendar year.

10. A *tertiary institution* is defined as any educational institution other than a school.

11. *Leavers* are defined as persons who were full-time students at any time in the previous calendar year but were not full-time students at the time of the survey. It should be noted that 6.9 per cent of leavers left full-time education during the period January 1987 through to the survey date. Also, 83,600 persons who attended school full-time at some time in the previous year and left, but were attending full-time education at any tertiary institution at the time of the survey are not included in the definition of leavers. Information about this group can be obtained from Table 9.

12. *Apprentices* include only those employed persons aged 15 to 34 who indicated in the survey that they were apprentices.

13. The *field of trade* is derived from information provided by apprentices on their occupation (see paragraphs 24 to 26).

14. Unless otherwise stated, all characteristics referenced in this publication relate to the week before the interview.

### Results of the survey

15. Due to differences in the method of estimation used in this supplementary survey and that used in the labour force survey, there are some small variations between estimates in this publication and those in the corresponding issue of *The Labour Force, Australia* (6203.0).

16. The estimates in this publication refer to information collected in the survey month and, due to seasonal factors, may not be representative of other months of the year.

17. A publication (6241.0) containing a summary of the results of the survey was issued on 25 August 1987.

18. Results of similar surveys, the first conducted in February 1964, have been published in previous issues of this publication. Information on apprentices was collected for the first time in May 1983.

19. It is proposed that this survey will be conducted next in May 1988.

### Unpublished tables

20. In some cases, the ABS can also make available information which is not published. This information may be made available in one or more of the following forms: microfiche, photocopy, data tape, computer print-out, manually-extracted tabulation. In general, a charge is made for providing unpublished information. Inquiries should be made to the officer whose name appears in the *Phone Inquiries* section at the front of this publication, or to Information Services in the nearest ABS Office.

## Discontinuities in the series

21. The scope of surveys prior to 1977 was restricted to persons aged 15 to 24 and from 1977 to 1980 inclusive, 15 to 25. In 1981 the survey was expanded to include all persons aged 15 to 64. Care should be exercised in comparing estimates from this survey for persons aged 15 to 24 with those from surveys conducted in the year 1977 to 1980.

22. Since 1979, and also in 1975 and 1976, the survey has been conducted in May. However, in 1977 and 1978 it was conducted in August and from 1964 to 1974 in February. Care should be taken in comparing estimates from this survey with those from surveys which were conducted at different times of the year.

23. Estimates for 1986 and 1987 are based on a revised labour force questionnaire introduced in April 1986. The definition of employment was expanded, resulting in decreases in the estimates of unemployed persons and persons not in the labour force. Further information is contained in *The Labour Force, Australia* (6203.0) and in an information paper *Questionnaires Used in the Labour Force Survey* (6232.0).

24. Classification of occupation according to the Australian Standard Classification of Occupations (ASCO 1986) was introduced in the August 1986 labour force survey, replacing the Classification and Classified List of Occupations (CCLO) used in previous surveys. The main difference between these classifications is that ASCO occupations are classified on the basis of the level and specialisation of skill required for the satisfactory performance of primary tasks. For a more detailed explanation of ASCO see the appendix to *The Labour Force, Australia, August 1986* (6203.0).

25. To provide a link between the two classifications, a matrix has been produced and is shown in Table 41 of *The Labour Force, Australia, August 1986* (6203.0). It shows the relationship between ASCO and CCLO at the broadest classification level (the Major Group). The estimates in the matrix are based on a sub-sample of respondents to the May 1986 labour force survey.

26. The conversion to ASCO from the CCLO has also affected the *field of trade* classification for apprentices. This change means that field of trade estimates from this survey are not comparable with those from previous surveys.

## Reliability of the estimates

27. Estimates in this publication are subject to sampling and non-sampling error. For more information refer to the Technical Note.

## Related publications

28. Other ABS publications which may be of interest include:

*The Labour Force, Australia* (6203.0)—issued monthly

*Labour Force Status and Educational Attainment, Australia* (6235.0)—issued annually

*Labour Force Experience, Australia* (6206.0)—issued annually

*Persons Not in the Labour Force, Australia* (6220.0)—issued twice-yearly

*Job Search Experience of Unemployed Persons, Australia* (6222.0)—issued two-yearly

29. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

## TECHNICAL NOTE

### Estimation procedure

The estimates are derived from the population survey by use of a ratio estimation procedure, which ensures that the estimates conform to an independently estimated distribution of the population for each capital city and remainder of State by age and sex, rather than to the corresponding distribution within the sample itself.

### Reliability of the estimates

2. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they are subject to sampling variability; that is, they may differ from those that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the number that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the likely difference is the *relative standard error*, which is obtained by expressing the standard error as a percentage of the estimate.

3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. A table of standard errors for general application is given on the following page. Since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics these figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude.

4. An example of the calculation and the use of standard errors in relation to estimates of persons is as follows. Table 13 shows the estimated number of persons aged 15 to 24 who attended an educational institution full-time in 1986 is 1,124,900. Since this estimate is between 1,000,000 and 2,000,000 in the standard error table, the standard error for Australia will be between 9,700 and 12,300 and can be approximated as 10,000 (rounded to the nearest 100). Therefore, there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall in the range 1,114,900 to 1,134,900 and about nineteen chances in twenty that the value will fall within the range 1,104,900 to 1,144,900. This example is illustrated in the following diagram.

5. As can be seen from the standard error table, the *smaller the estimate the higher is the relative standard error*. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates less than the lowest levels shown in the standard error table have not been published. Although in some cases estimates for these small components can be derived by subtraction, they should not be regarded as reliable.

6. Proportions and percentages formed from the ratio of two estimates are also subject to sampling errors. The size of the error depends on the accuracy of both the numerator and the denominator. The formula for the relative standard error (RSE) of a proportion is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 + [RSE(y)]^2}$$

7. Considering the example from paragraph 4 above, of the 1,124,900 persons aged 15 to 24 who attended an educational institution full-time in 1986 891,000 or 79.2 per cent attended school. The standard error of 891,000 is approximately 9,200 so the relative standard error is 1.0 per cent. The relative standard error for 1,124,900 is 0.9 per cent. Applying the above formula, the relative standard error of the proportion is  $\sqrt{(1.0)^2 - (0.9)^2}$  or 0.4 per cent, giving a standard error for the proportion (79.2 per cent) of 0.3 percentage points. Therefore, there are about two chances in three that the proportion of persons aged 15 to 24 who attended school full-time in 1986 is between 78.9 per cent and 79.5 per cent and nineteen chances in twenty the proportion is within the range 78.6 per cent to 79.8 per cent.

8. Published estimates may also be used to calculate the difference between two survey estimates (of numbers or percentages). Such an estimate is subject to sampling error. The sampling error of the difference between two estimates depends on their standard errors and the relationship (correlation) between them. An approximate standard error (SE) of the difference between two estimates ( $x-y$ ) may be calculated by the following formula:

$$SE(x-y) = \sqrt{[SE(x)]^2 + [SE(y)]^2}$$

While this formula will only be exact for differences between separate and uncorrelated characteristics of sub-populations it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents, and errors made in coding and processing data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.
